

# A Collaborative Platform for Large-Scale 3D Geological Modeling

## - *Experiences from Denmark*

## Groundwater mapping in Denmark

25 years, groundwater mapping campaign in Denmark.

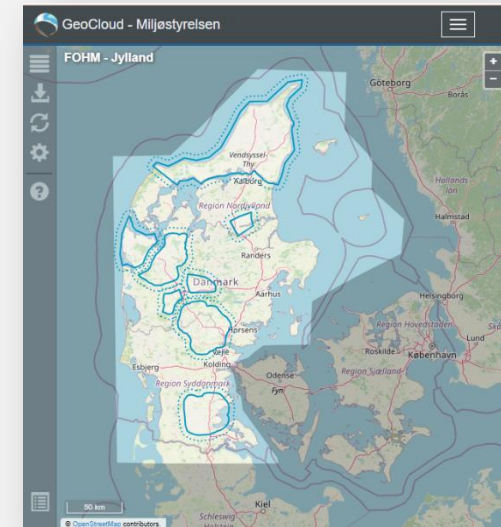

Large amounts of data has been collected: borehole information, **geophysics** etc.

Databases containing borehole information and geophysics

All data and knowledge are compiled into a confined national 3D hydrogeological model

– a 300 mio € model!

- go through needs, process and result

## 3D hydrogeological as base for groundwater management and planning

The model defines:

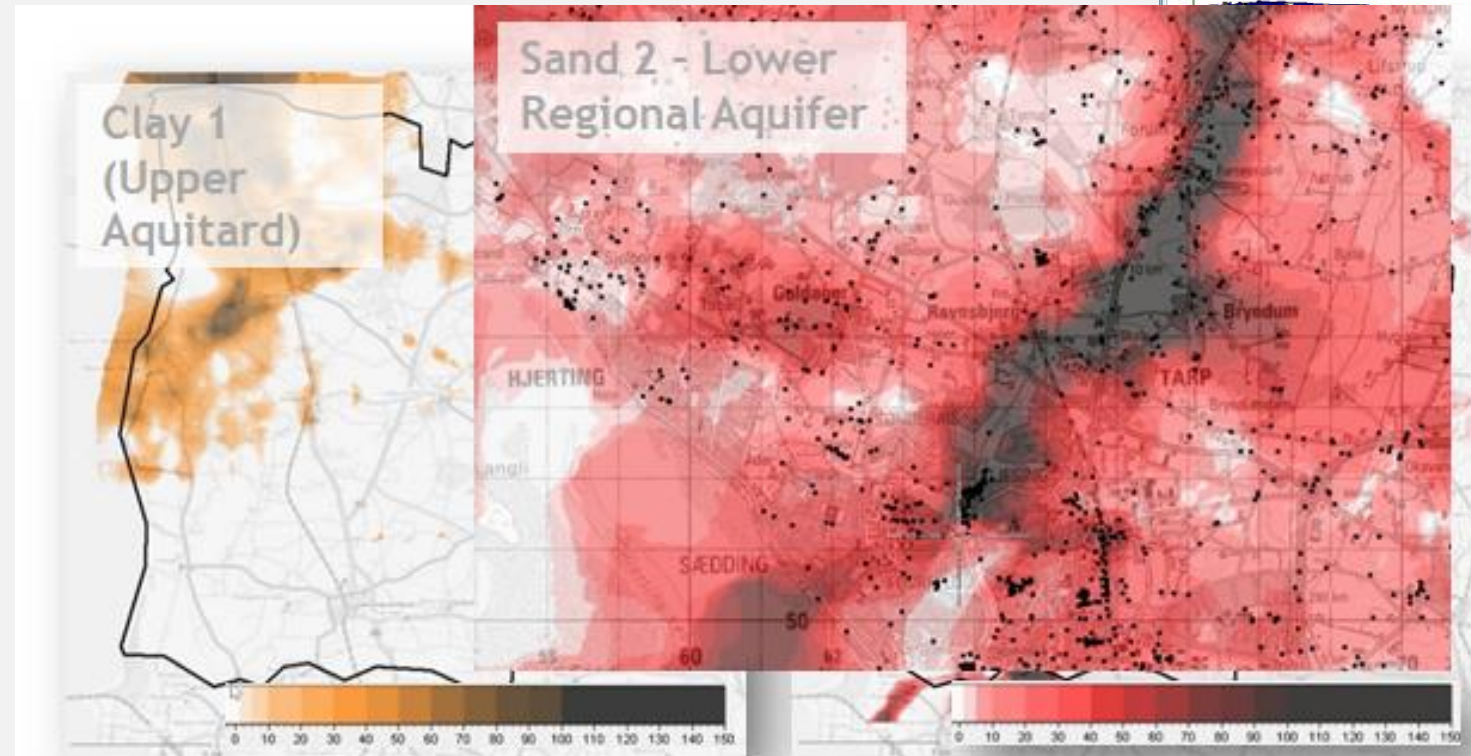

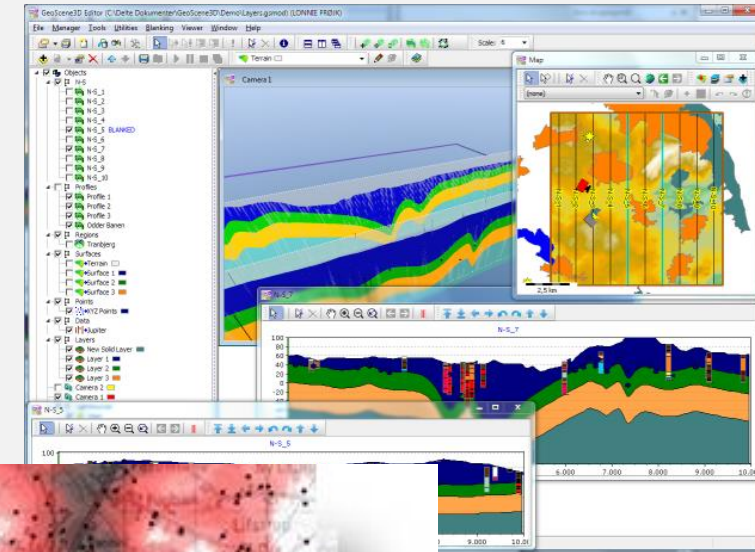

- Geology/Hydrogeology
- Basins
- Aquifers/aquitards
- Interconnections

Answer questions:

- Recharge
- Volumes
- Potential threats
- Etc...

Delineate:

- Further knowledge needed?

## *(Hydro)geological modeling in Denmark*

- Conceptual hydro stratigraphic layered modeling approach (manual, cognitive approach)
- Different geo-modeling software's until 2006 – no standards (after 2006, GeoScene3D defined as the standard tool)
- No well-defined modeling concepts before 2008 (GW mapping campaign started back in 1999) (after 2008 guidelines were defined by GEUS and partners)

## The Danish Model Database (250+ models) – A mixed box of candy

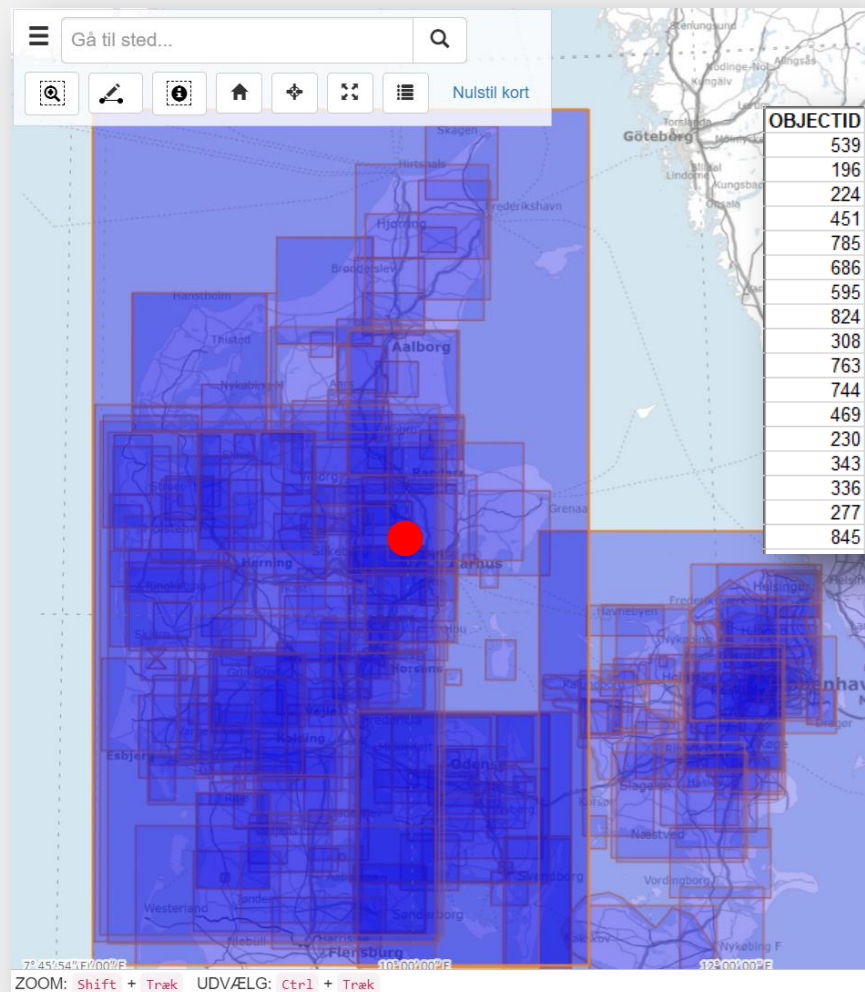

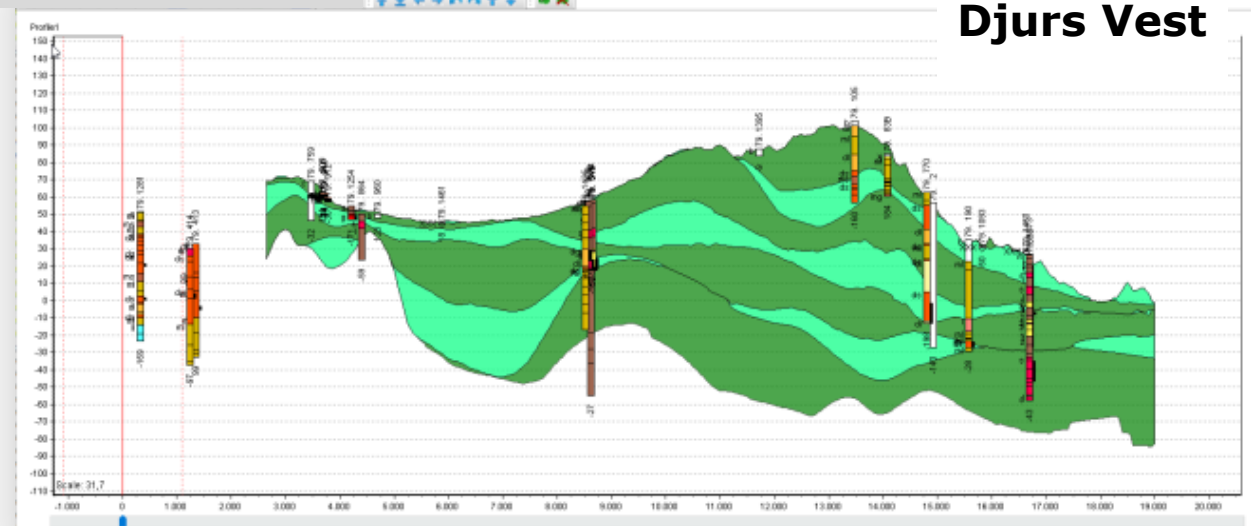

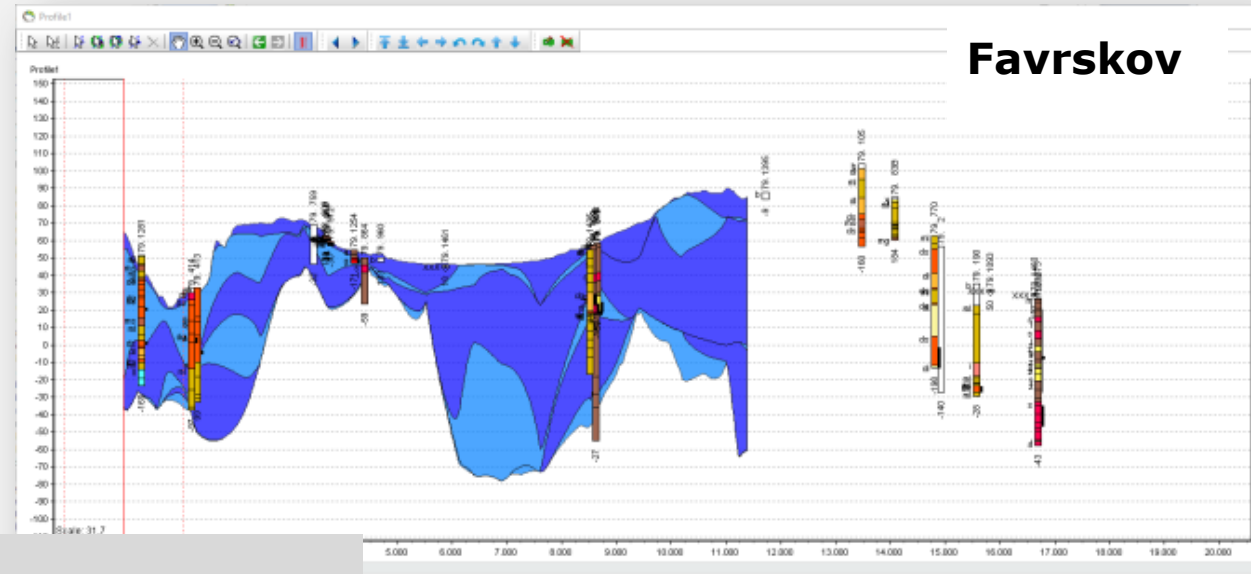

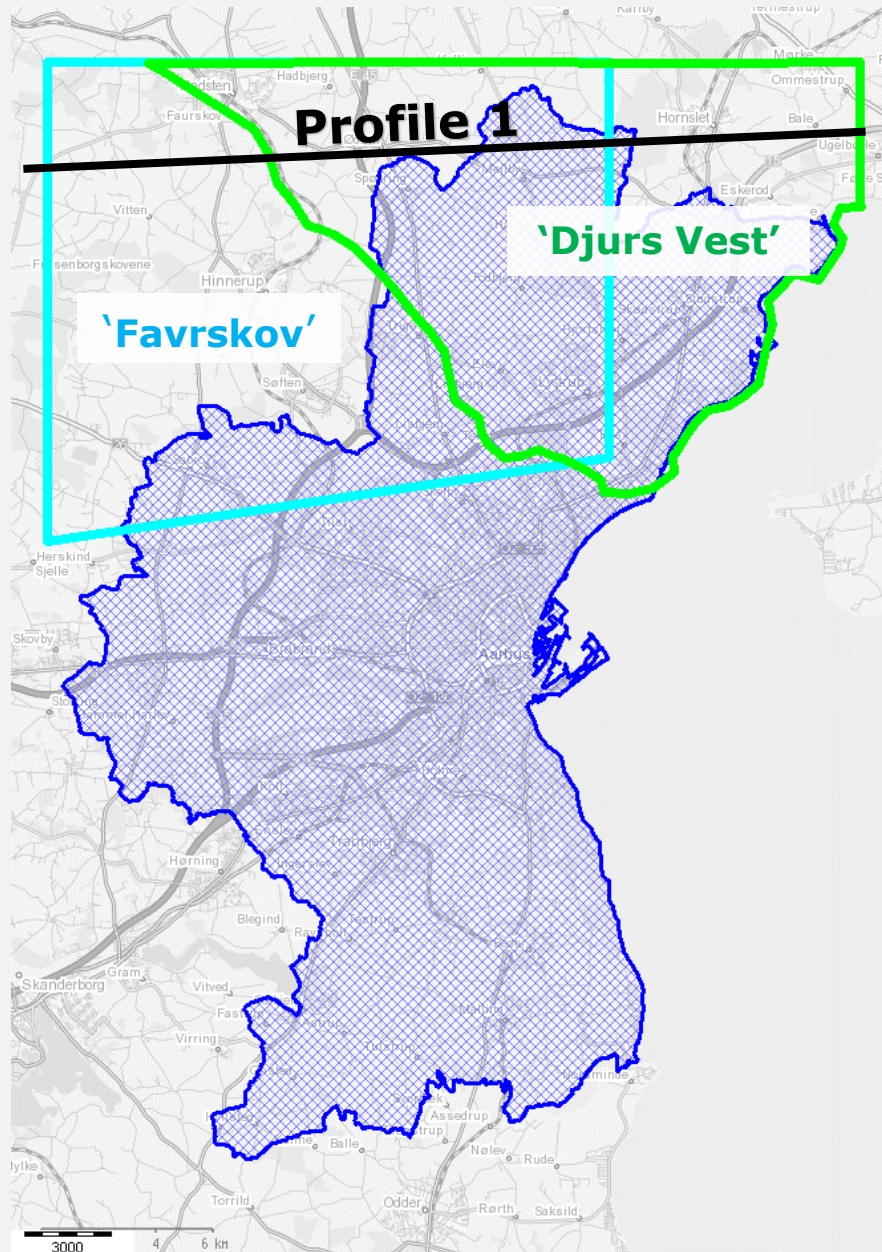

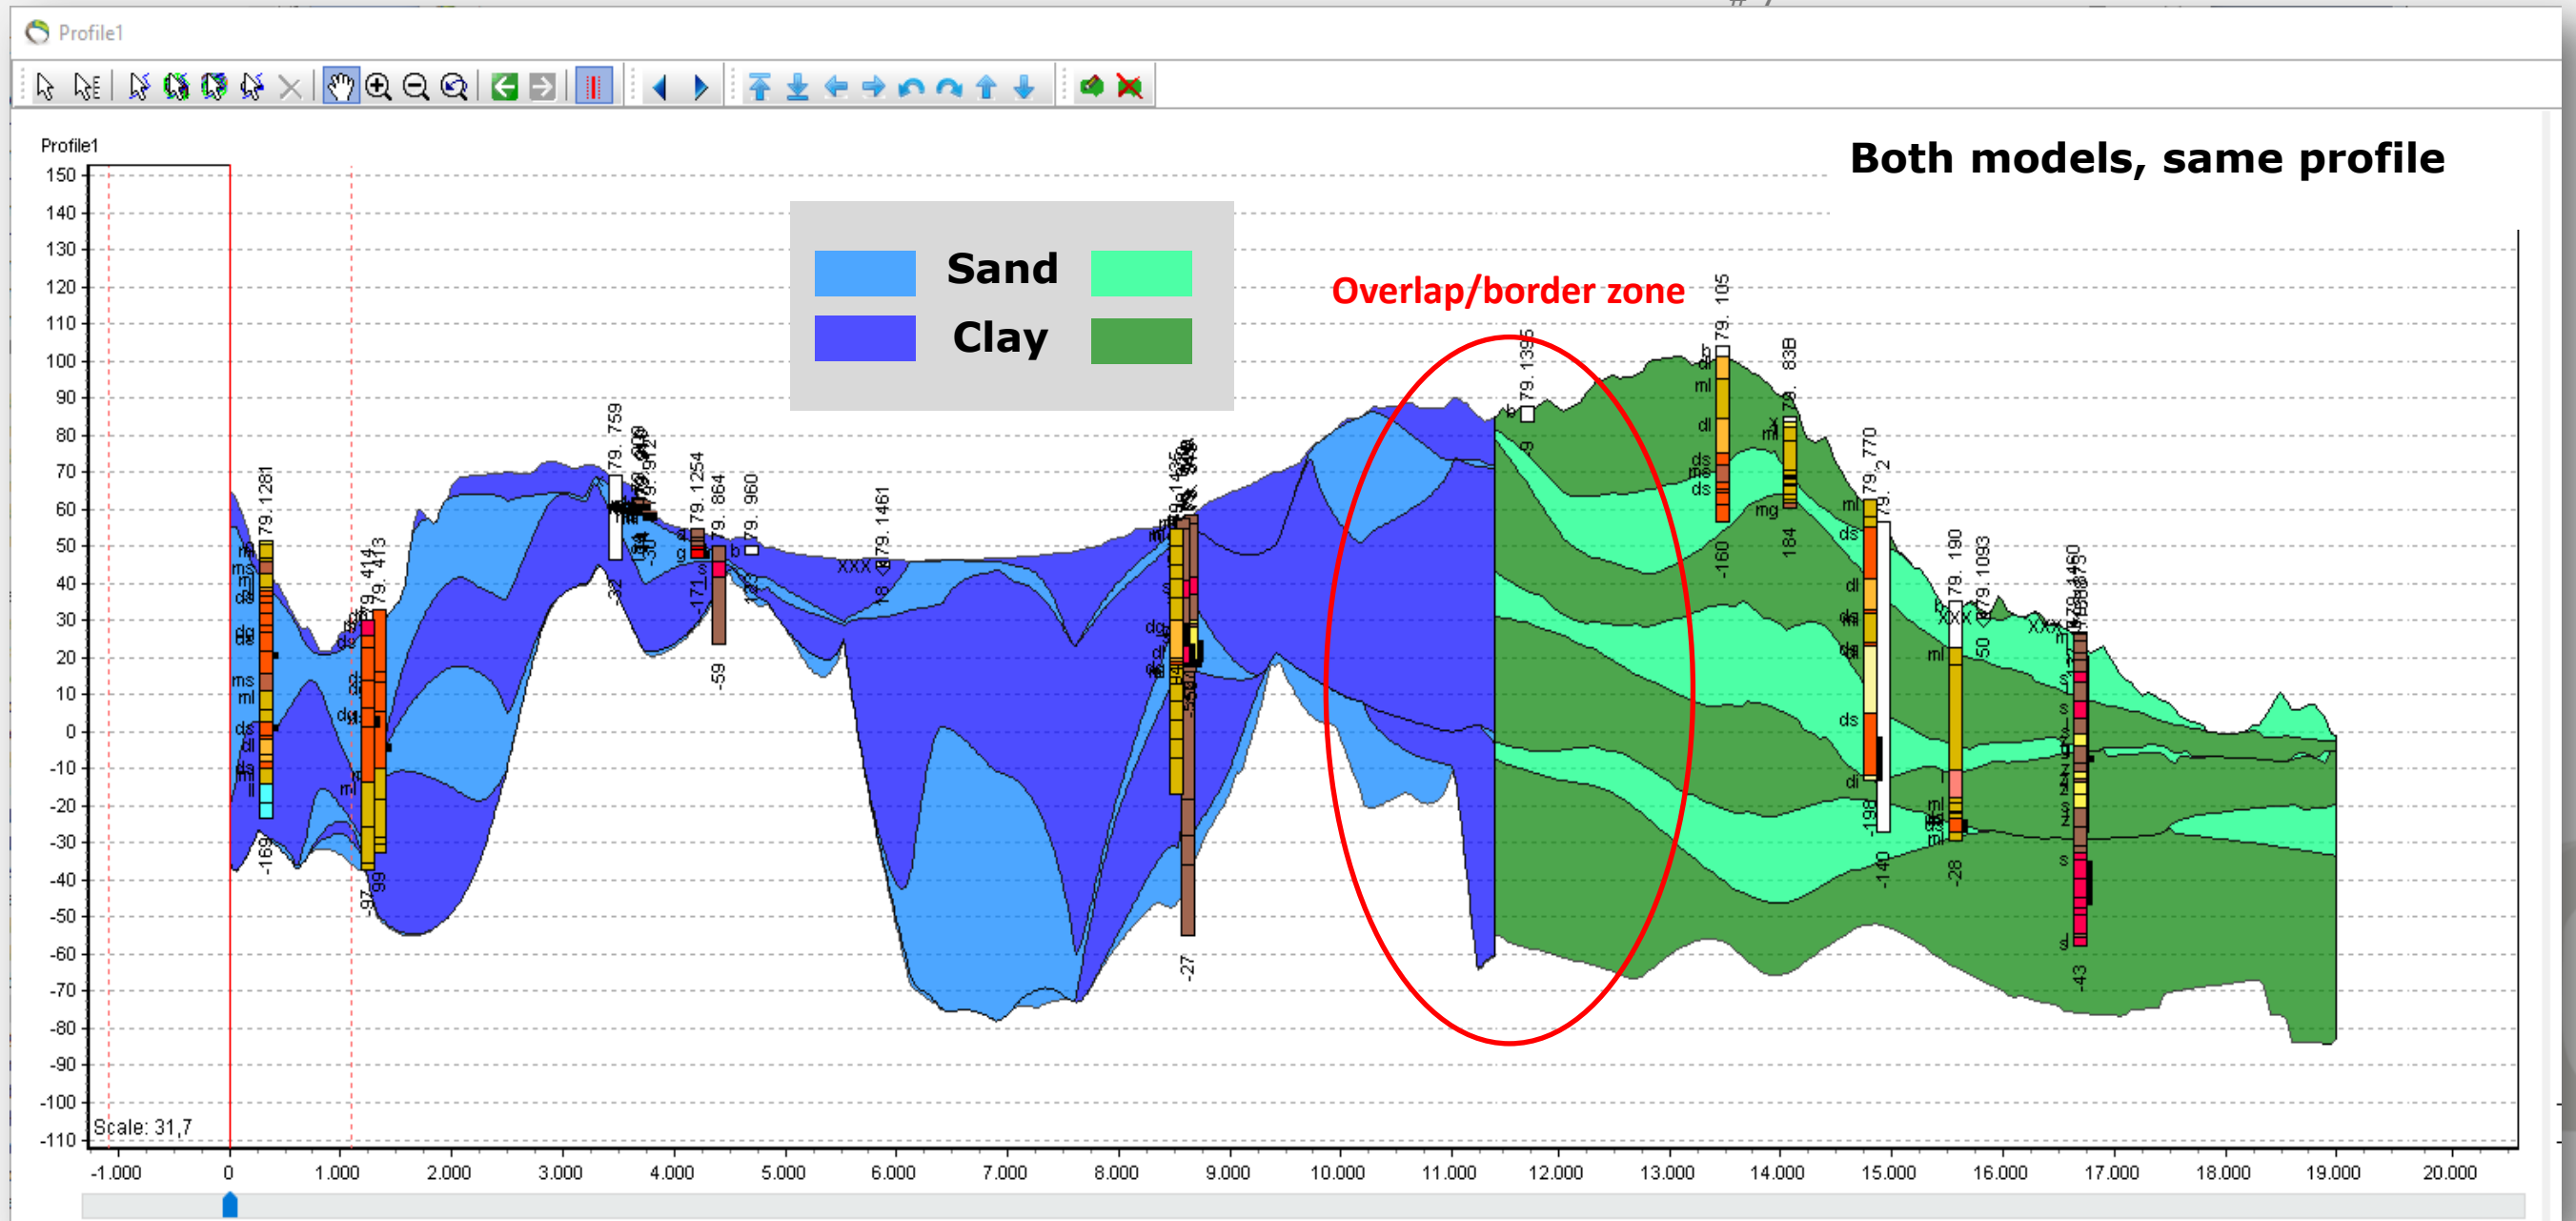

Table: List of models at the red dot

# of models at the red dot (17)

- Which one to choose?
- Which one/ones are used by the authorities?
- (Includes models from the last 25+ years).

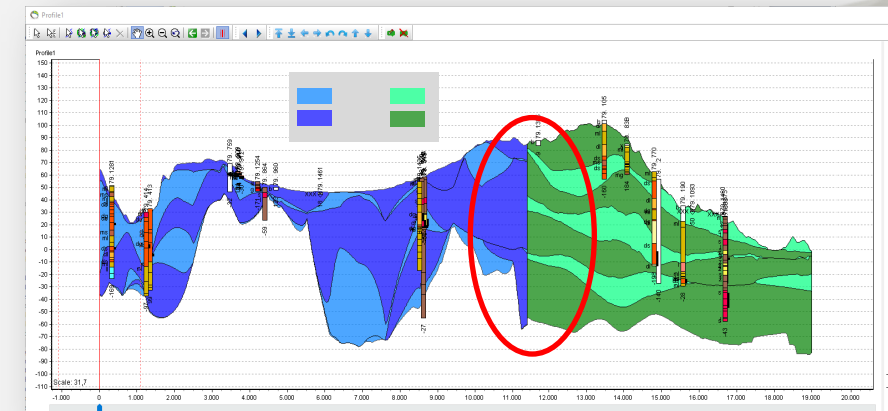

## *Why these differences?*

- Different models, different premises/scope
- Economy and time (Quick & Dirty, State of the Art?)
- Skills and experience
- Development in mapping methods over time
- More data and knowledge over time
- Better modeling and visualization tools over time

## In 2018

The Danish EPA wanted to combine the best of all models into one single hydrostratigraphic model - the *FOHM model*

### “Common Public Hydrogeologic Model”

<b>Budget:</b>	1,2 mio. €. In 2018 – no sooner, no later!
<b>Goal:</b>	A layer-based model incl. interpretation points and hydrostratigraphic units Based on existing work – no new interpretations Modeling tool: GeoScene3D
<b>Timeline:</b>	8 month in total!
<b>Partners:</b>	EPA, GEUS, I•GIS, Private consultants

## The model framework / the reference model – *the maximum stratigraphy;* *45 hydrostratigraphic layers.*

### Quaternary layers

- Surface near, local units
- Regional plateau units
- Buried valleys

### Miocene layers

- Regional stratigraphic units from national model
- Mostly defined in central Jutland

### Pre Miocene

- Chalk
- Salt

Pre-Miocene

Miocene

Quaternary

## Modeling areas

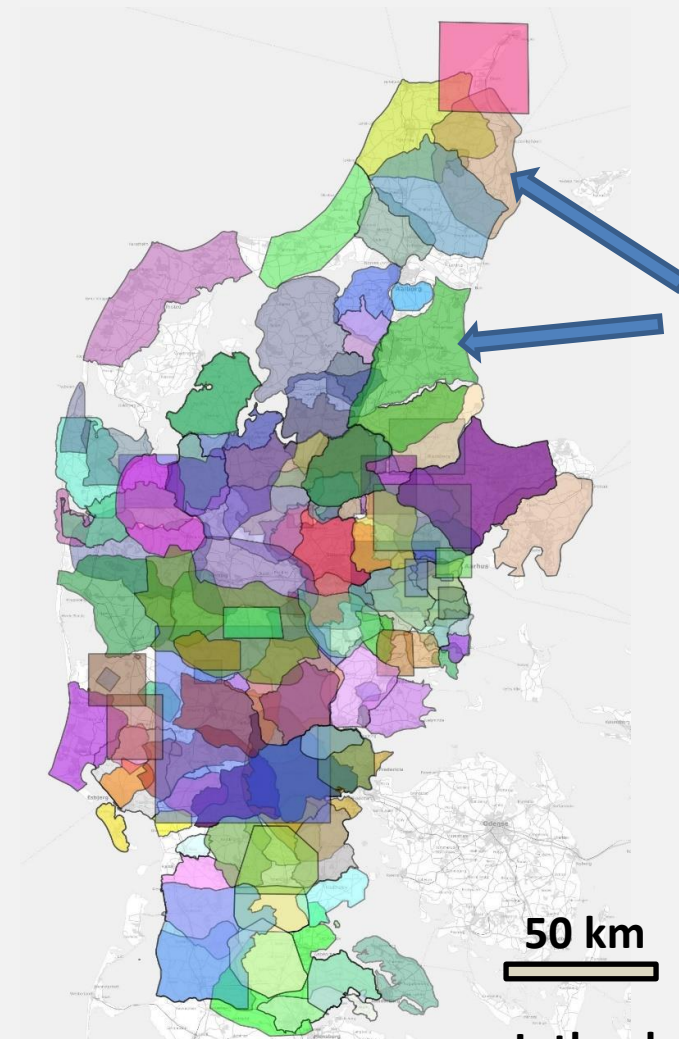

...distributed taking consultants local references into account

**Consultant 1**  
(consortium of 2  
companies)

**Consultant 2**

**Consultant 3**

**Individual models**

**More than 150  
models in total.  
Typical 6-12 layers  
and size of 400-  
1200 km<sup>2</sup>.**

50 km

Jutland:  $\approx 30.000 \text{ km}^2$

## Model selection and quality categories

- “Good”
- “Ok”
- “Low”
- “Not to be used”

87 hydrostratigraphic models were selected

More than one “good” model in an area: Prioritized list was made as well.

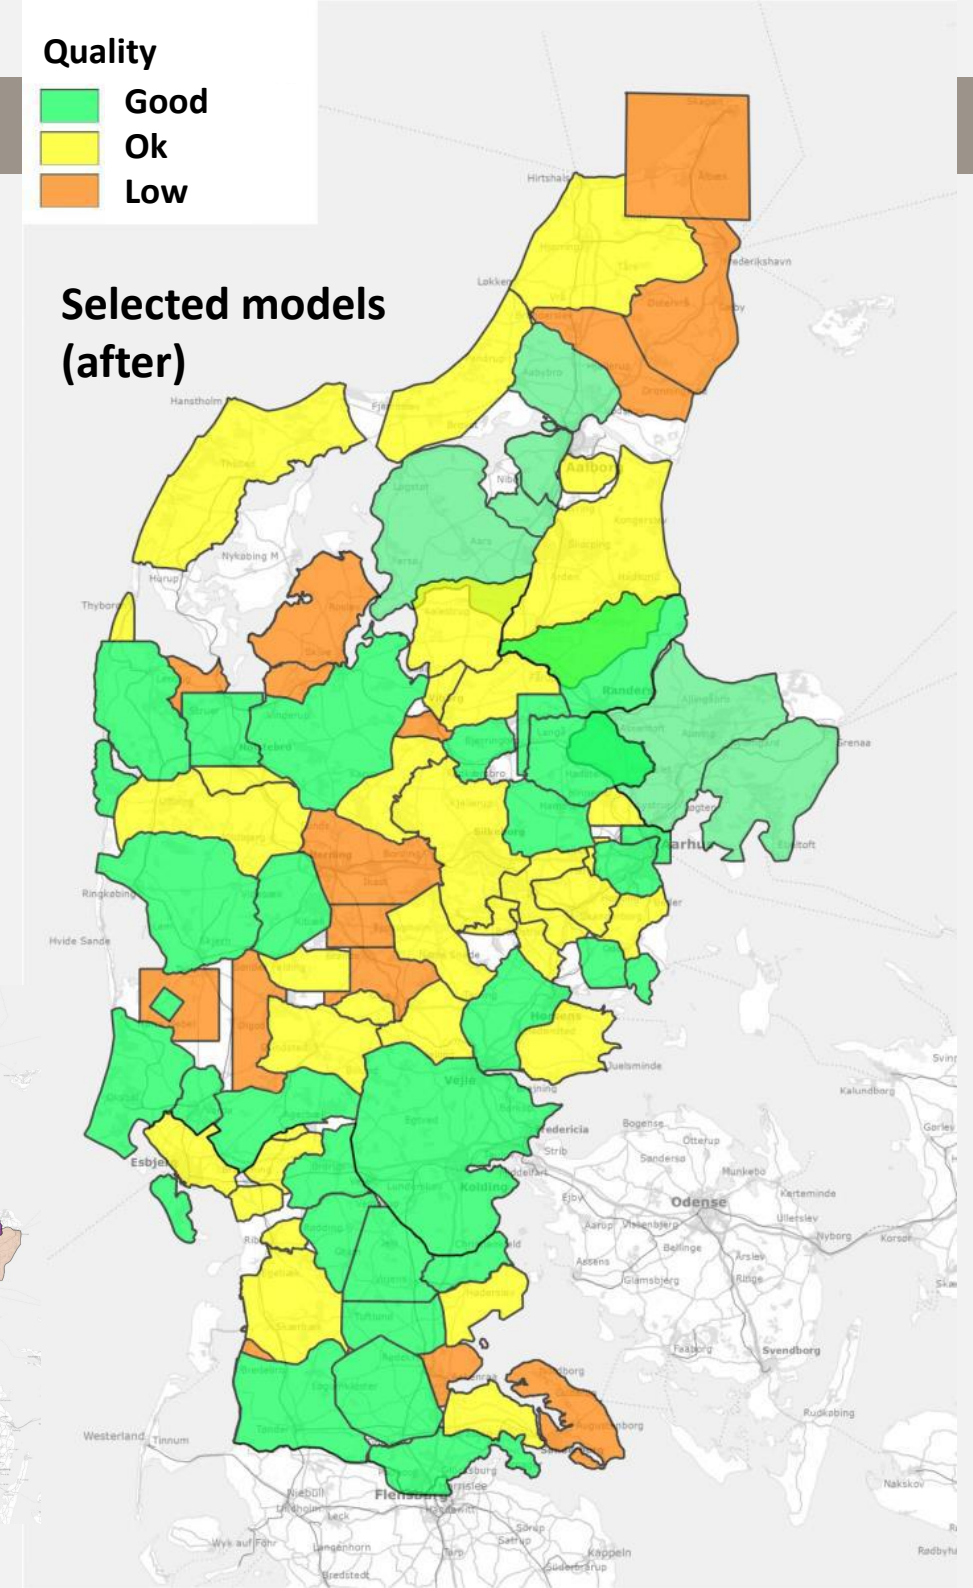

### Quality

### Selected models (after)

All models (before)

# FOHM workflow

One model:

Cell size 100x100m

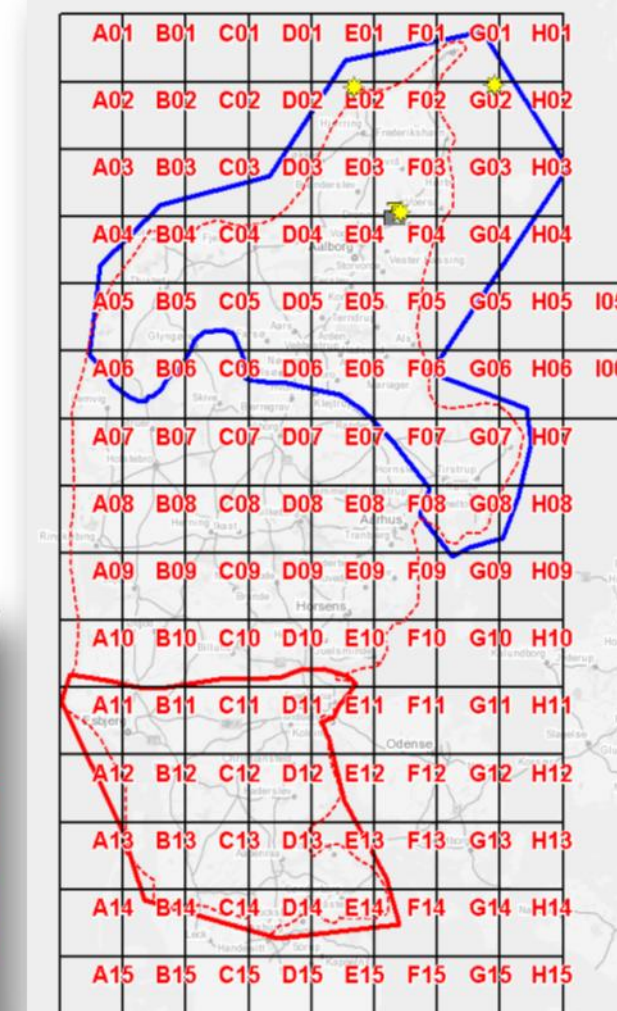

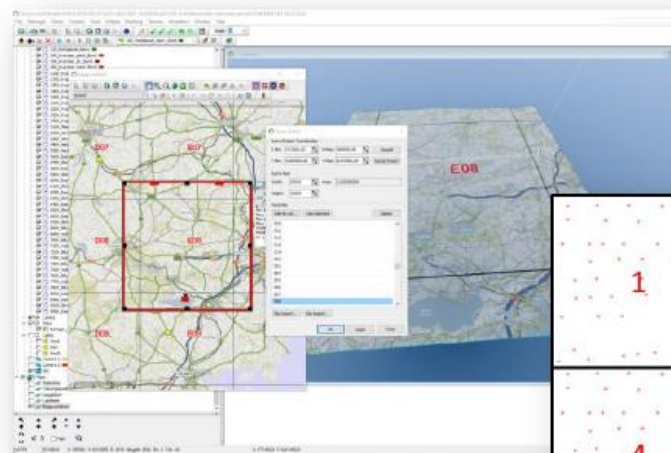

Outline: 400x200km

GeoScene3D software:

Scene Extent concept

## Scene Extents og Tiles

- Scene Extents: 35 x 35 km (1225 km<sup>2</sup>)
- 82 tiles. Tile = Scene Extent + 5 km buffer
- Modeling done within scene extent

## FOHM workflow

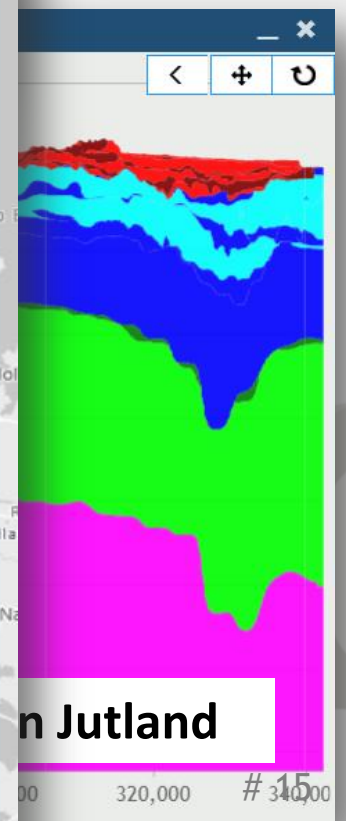

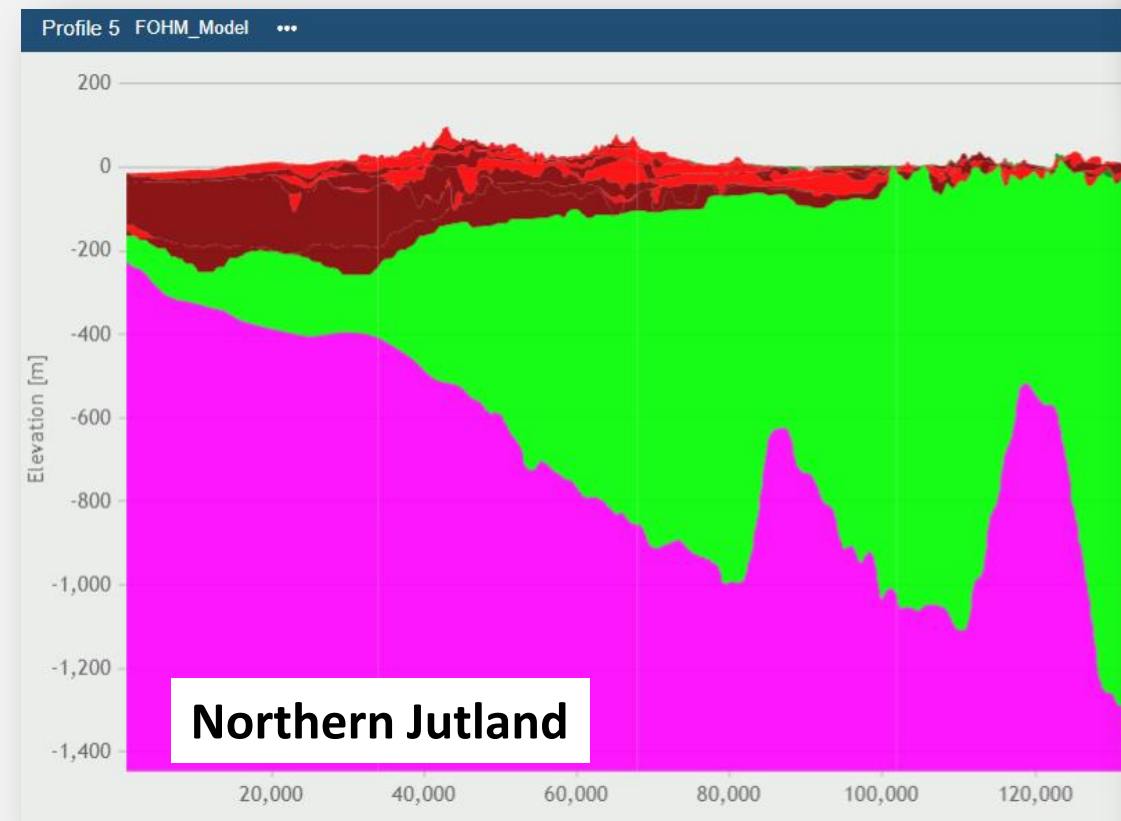

Point density within one layer

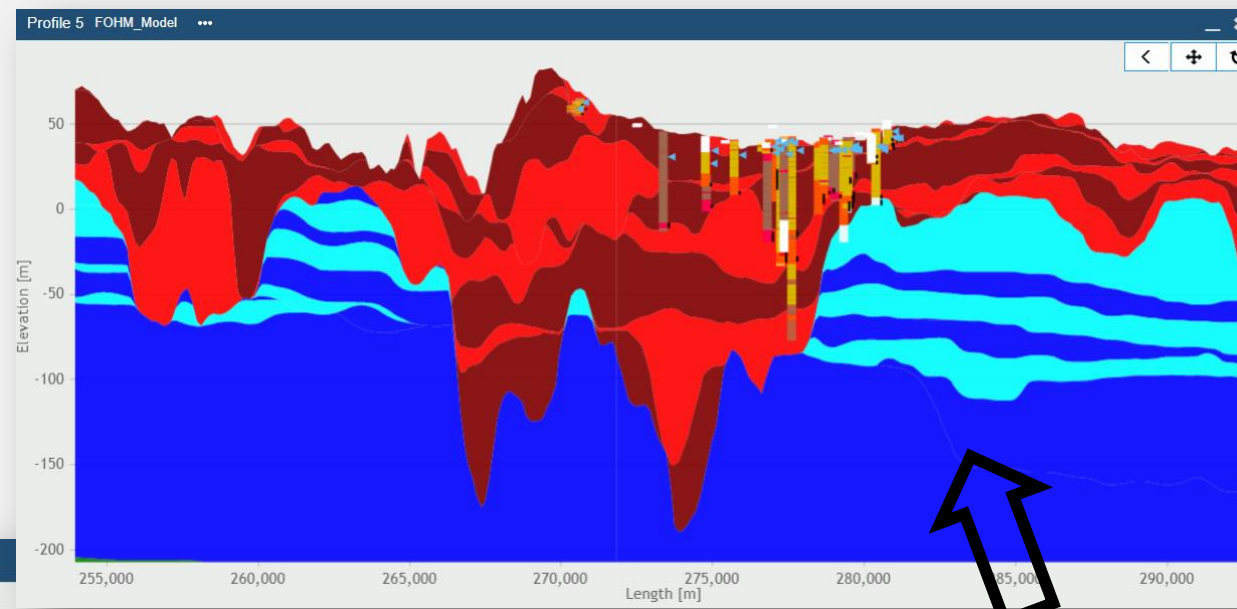

**We succeeded**  
**– output examples**  
 Cross sections (user defined).

(Profile below: 345 km)

**We succeeded**  
– **output examples**  
Cross sections (user defined).

(Profile below: 345 km)

**Northern Jutland**

**Middle Jutland**

**Southern Jutland**

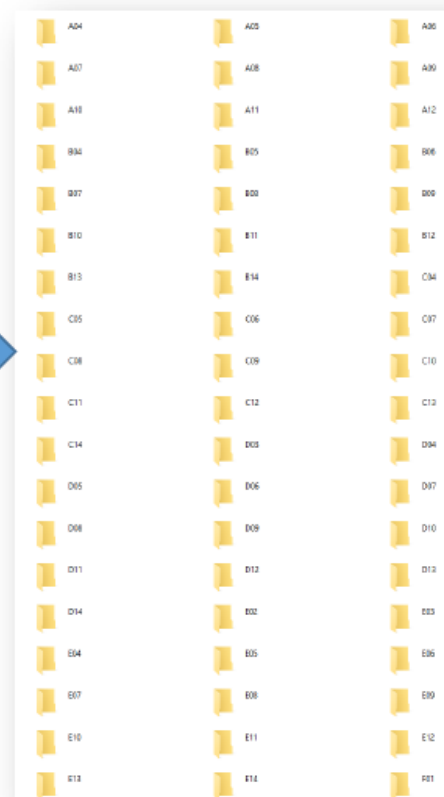

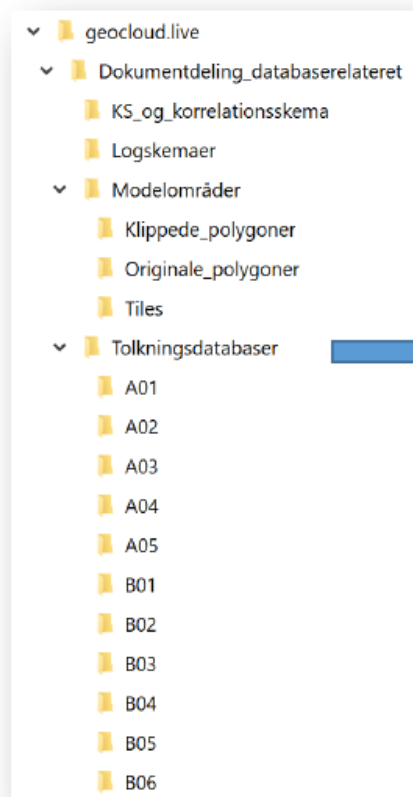

## Updating - problematic

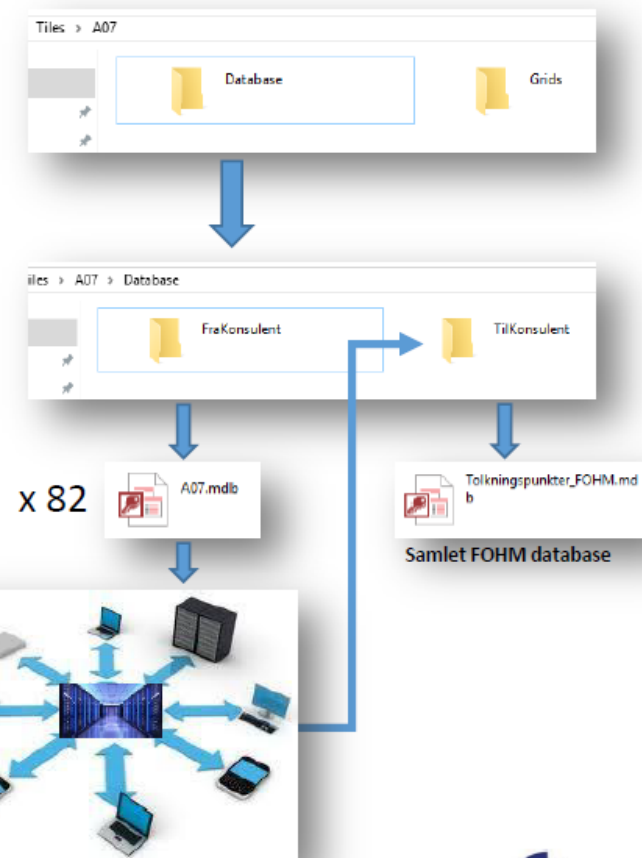

## Upload og synkronisering – arbejdsgang

- Login på ftp-server (geocloud.live)
- Her findes mappestruktur

### Lidt teknisk info

- Den samlede FOHM-database fylder ca. 1GB
- De enkelte lag rummer fra 567 til 244.896 punkter
- Samlet findes 2.137.665 tolkningspunkter; 1.910.551 kvartære og 227.114 prækvartære

## LARCOS system - part of GeoCloud DMS

**GeoCloud - Miljøstyrelsen**

LARCOS Administration Help tmp@i-gis.dk

Show History ☐

**Areas currently being updated**

**Supports several models**

**Different users – different access levels:**

- Administration and QC
- Check out – check in
- Upload – download data
- View-only
- Public/unpublic data

**GeoCloud LARCOS Architecture Diagram:**

The diagram illustrates the workflow between GeoScene3D (or GIS systems), QC (Quality Control), and GeoCloud LARCOS. GeoScene3D feeds into QC, which then feeds into GeoCloud LARCOS. GeoCloud LARCOS also feeds back into GeoScene3D. A 'Check Out/Check In' dialog box is shown, indicating the process of checking out data for editing.

Since 2019:

Model updates based on:

- New data:
  - Borehole, geophysics etc.
- Specific needs
  - Land use
  - Development planning
  - Sparse data coverage – i.e. large uncertainty

## Lessons learned

Many many things but summarized in a few sentences:

... ONE model as reference for the administrative basis

... “one model” with common maximum stratigraphy to define the geologic framework (compromises must be accepted) for further work

... we were able to work closely together, independently of organization

... a need for a common multiuser platform to handle the model and updates

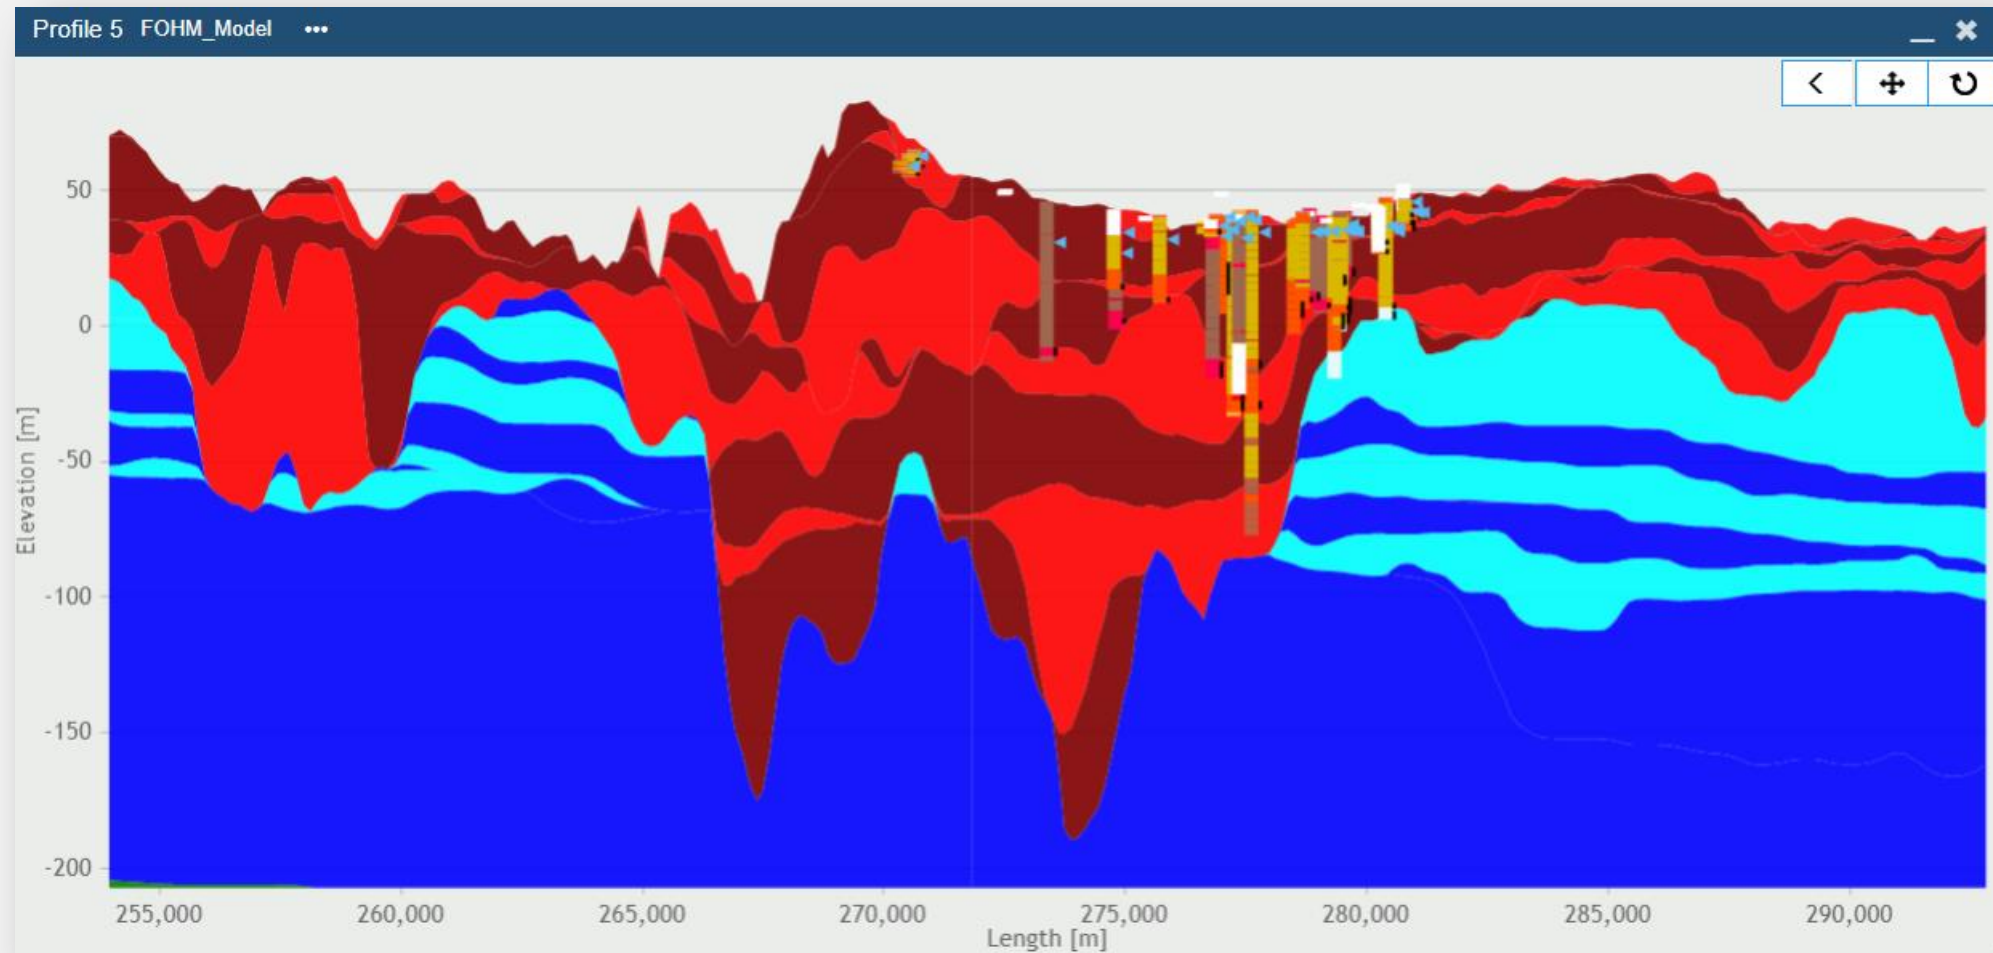

... platform developed, in close collaboration with administrators, stakeholders, the public and consultants.

The LARCOS system is now running the maintenance process

Latest version:  
70 layers

# Questions?

# Thank you
